Acknowledgments

This publication has emanated from research conducted with the financial support of Science Foundation Ireland under Grant number 12/RC/2289-P2 at Insight the SFI Research Centre for Data Analytics at UCC, which is co-funded under the European Regional Development Fund.

A version of this material was developed as part of the ECLiPSe ELearning course:

https://eclipseclp.org/ELearning/index.html.

Support from Cisco Systems and the Silicon Valley Community Foundation is gratefully acknowledged.

Objectives

- Overview of Core Constraint Programming
- Three Main Concepts
 - Constraint Propagation
 - Global Constraints
 - Customizing Search
- Topics will be treated in more detail in later parts of the school
- Based on Examples, not Formal Description

Insight Centre for Data Analytics

CP Week 2025

Slide 5

Outline

- Why Constraint Programming?
- Constraint Propagation
- Global Constraints
- Customizing Search

Tutorial Based on ECLiPSe ELearning Course

- Self-study course in constraint programming
- Supported by Cisco Systems and Silicon Valley Community Foundation
- Multi-media format, video lectures, slides, handout etc
- https://eclipseclp.org/ELearning/index.html

CP Week 2025

Slide 7

Also Part of CRT-AI Constraint Week

- Annual one week course on CP and Optimization in Ireland
- Part of national training program for PhD students in AI
- https://www.crt-ai.ie/

Constraint Programming - in a nutshell

- Declarative description of problems with
 - Variables which range over (finite) sets of values
 - Constraints over subsets of variables which restrict possible value combinations
 - A solution is a value assignment which satisfies all constraints
- Constraint propagation/reasoning
 - Removing inconsistent values for variables
 - Detect failure if constraint can not be satisfied
 - Interaction of constraints via shared variables
 - Incomplete
- Search
 - User controlled assignment of values to variables
 - Each step triggers constraint propagation
- Different domains require/allow different methods

Insight Centre for Data Analytics

CP Week 2025

Slide 9

Constraint Programming is Different

- Declarative Programming
 - Concentrate on what you want
 - Not how to get there
 - Program != Algorithm
 - Program = Model
- Applied to Combinatorial Problems
 - No complete polynomial algorithms known (exist?)
 - CP less ad-hoc than heuristics
 - Models can evolve

A Subtractive Process

"Oh, bosh, as Mr. Ruskin says. Sculpture, per se, is the simplest thing in the world. All you have to do is to take a big chunk of marble and a hammer and chisel, make up your mind what you are about to create and chip off all the marble you don't want."-Paris Gaulois.

Slide 11

Basic Process

More Realistic

Insight Centre for Data Analytics

CP Week 2025

Slide 13

Dual Role of Model

- Allows Human to Express Problem
 - Close to Problem Domain
 - Constraints as Abstractions
- Allows Solver to Execute
 - Variables as Communication Mechanism
 - Constraints as Algorithms

Modelling Frameworks

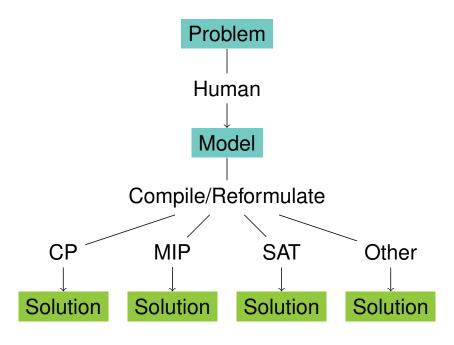

- MiniZinc (NICTA, Monash University, Australia)
- NumberJack (Insight, Ireland)
- EssencePrime/SavilleRow (UK)
- CPMpy (KU Leuven)
- Allow use of multiple back-end solvers
- Compile model into variants for each solver
- A priori solver independent model(CP, MIP, SAT)

Insight Centre for Data Analytics

CP Week 2025

Slide 15

Framework Process

Why use Puzzles as Examples?

- Easy to understand the problem
- Solvable by hand without specialized knowledge
- Possible to compare automated to manual solving process

The puzzle, though inanimate, is presented as a solvable problem without lasting negative consequences, a very low-risk low-reward situation. By being a puzzle, the object is attempting to convince the user that it must be completed.

Slide 17

Part I

Basic Constraint Propagation

Example 1: SEND+MORE=MONEY

- Example of Finite Domain Constraint Problem
- Models and Programs
- Constraint Propagation and Search
- Some Basic Constraints: linear arithmetic, alldifferent, disequality
- A Built-in search
- Visualizers for variables, constraints and search

Insight Centre for Data Analytics

CP Week 2025

Slide 19

Problem Definition

A Crypt-Arithmetic Puzzle

We begin with the definition of the SEND+MORE=MONEY puzzle. It is often shown in the form of a hand-written addition:

The puzzle was first proposed by Henry Dudeney in the Strand Magazine from 1924.

Rules

- Each character stands for a digit from 0 to 9.
- Numbers are built from digits in the usual, positional notation.
- Repeated occurrence of the same character denote the same digit.
- Different characters denote different digits.
- Numbers do not start with a zero.
- The equation must hold.

Insight Centre for Data Analytics

CP Week 2025

Slide 22

Model

- Each character is a variable, which ranges over the values 0 to 9.
- An alldifferent constraint between all variables, which states that two different variables must have different values. This is a very common constraint, which we will encounter in many other problems later on.
- Two disequality constraints (variable X must be different from value V) stating that the variables at the beginning of a number can not take the value 0.
- An arithmetic equality constraint linking all variables with the proper coefficients and stating that the equation must hold.

SEND+MORE=MONEY Models

- ECLiPSe Show
- MiniZinc → Show
- NumberJack Show
- CPMpy ► Show
- Choco-solver Show

A Note on Syntax

- Some formulations may seem simpler than others
- This largely is an artifact of a very simple problem
- In most models, you do not write down constraints one by one
- You create constraints based on data
- Ease of integration becomes more important than syntax
- Debugging tools for those who need a debugger :-)

Insight Centre for Data Analytics

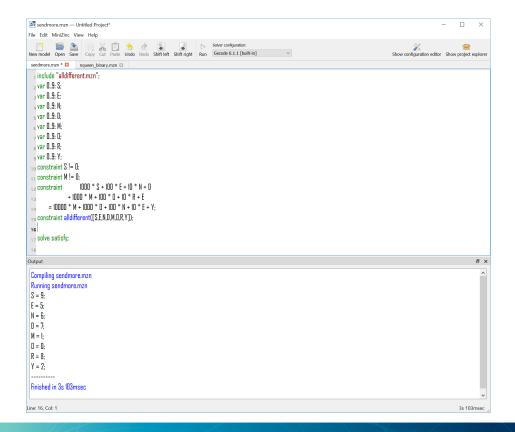

CP Week 2025

Slide 31

Choice of Model

- This is *one* model, not *the* model of the problem
- Many possible alternatives
- Choice often depends on your constraint system
 - Constraints available
 - Reasoning attached to constraints
- Not always clear which is the best model
- Often: Not clear what is the problem

Running the Program (MiniZinc IDE)

Insight Centre for Data Analytics

CP Week 2025

Slide 33

Question

- But how did the program come up with this solution?
- We show solution with ECLiPse, other solvers vary slightly

Alldifferent Constraint

```
include "alldifferent.mzn";
constraint alldifferent([S,E,N,D,M,O,R,Y]);
```

- Built-in alldifferent predicate included
- No initial propagation possible
- Suspends, waits until variables are changed
- When variable is fixed, remove value from domain of other variables
- Forward checking

Equality Constraint

- Normalization of linear terms
 - Single occurence of variable
 - Positive coefficients
- Propagation

Insight Centre for Data Analytics

CP Week 2025

Slide 42

Normalization

Simplified Equation

$$1000 * S + 91 * E + 10 * R + D = 9000 * M + 900 * O + 90 * N + Y$$

Insight Centre for Data Analytics

CP Week 2025

Slide 44

Propagation

$$\underbrace{\frac{1000 * S^{1..9} + 91 * E^{0..9} + 10 * R^{0..9} + D^{0..9}}_{1000..9918} = \underbrace{\frac{1000..9918}{9000 * M^{1..9} + 900 * O^{0..9} + 90 * N^{0..9} + Y^{0..9}}_{9000..89919}}$$

Deduction:

$$M = 1, S = 9, O \in \{0..1\}$$

Why? ▶ Skip

Consider lower bound for S

$$\underbrace{1000 * S^{1..9} + 91 * E^{0..9} + 10 * R^{0..9} + D^{0..9}}_{9000..9918} = \underbrace{9000 * M^{1..9} + 900 * O^{0..9} + 90 * N^{0..9} + Y^{0..9}}_{9000..9918}$$

- Lower bound of equation is 9000
- Rest of lhs (left hand side) $(91 * E^{0..9} + 10 * R^{0..9} + D^{0..9})$ is atmost 918
- S must be greater or equal to $\frac{9000-918}{1000} = 8.082$
 - otherwise lower bound of equation not reached by lhs
- S is integer, therefore $S \ge \left\lceil \frac{9000-918}{1000} \right\rceil = 9$
- S has upper bound of 9, so S = 9

Insight Centre for Data Analytics

CP Week 2025

Slide 46

Consider upper bound of M

$$\underbrace{1000*S^{1..9} + 91*E^{0..9} + 10*R^{0..9} + D^{0..9}}_{9000..9918} = \underbrace{9000*M^{1..9} + 900*O^{0..9} + 90*N^{0..9} + Y^{0..9}}_{9000..9918}$$

- Upper bound of equation is 9918
- Rest of rhs (right hand side) 900 * O^{0..9} + 90 * N^{0..9} + Y^{0..9} is at least 0
- *M* must be smaller or equal to $\frac{9918-0}{9000} = 1.102$
- M must be integer, therefore $M \le \lfloor \frac{9918-0}{9000} \rfloor = 1$
- M has lower bound of 1, so M = 1

Consider upper bound of O

$$\underbrace{1000*S^{1..9} + 91*E^{0..9} + 10*R^{0..9} + D^{0..9}}_{9000..9918} = \underbrace{9000*M^{1..9} + 900*O^{0..9} + 90*N^{0..9} + Y^{0..9}}_{9000..9918}$$

- Upper bound of equation is 9918
- Rest of rhs (right hand side) $9000 * 1 + 90 * N^{0..9} + Y^{0..9}$ is at least 9000
- *O* must be smaller or equal to $\frac{9918-9000}{900} = 1.02$
- O must be integer, therefore $O \le \lfloor \frac{9918-9000}{900} \rfloor = 1$
- O has lower bound of 0, so $O \in \{0..1\}$

Slide 78

Some Differences

- Uses binary branching
 - var equal value, var not equal value
- Solutions in green, failure leafs in red, internal nodes in blue
- By default, shows all failed sub trees collapsed
- By default, uses different search strategy

Solution

Insight Centre for Data Analytics

CP Week 2025

Slide 80

Points to Remember

- Constraint models are expressed by variables and constraints.
- Problems can have many different models, which can behave quite differently. Choosing the best model is an art.
- Constraints can take many different forms.
- Propagation deals with the interaction of variables and constraints.
- It removes some values that are inconsistent with a constraint from the domain of a variable.
- Constraints only communicate via shared variables.

Points to Remember

- Propagation usually is not sufficient, search may be required to find a solution.
- Propagation is data driven, and can be quite complex even for small examples.
- The default search uses chronological depth-first backtracking, systematically exploring the complete search space.
- The search choices and propagation are interleaved, after every choice some more propagation may further reduce the problem.

Insight Centre for Data Analytics

CP Week 2025

Slide 83

For Puzzle Purists Only

- We did not follow the puzzler ethos!
- We should solve the puzzle without making choices
- Even a case analysis should be avoided
- The puzzle has a single solution, we should be able to deduce the solution
- In the process shown, we are limited by the underlying assumptions
 - Treat each constraint on its own, they interact only by domains of variables
 - We only use the constraints that we stated in the model
- Can we do better than that?

Better Reasoning

- Three possible approaches (possibly many more)
 - Full domain reasoning for arithmetic, not just bound reasoning
 - Interaction of *sum* and *alldifferent* constraints
 - Deduced implied constraint

Insight Centre for Data Analytics

CP Week 2025

Slide 85

Looking at more than just bounds

- We only considered the smallest and largest values that can be achieved in the sum constraint
- We can do more
 - Can any of the values between be expressed as the sum of the terms
 - Consider holes in the domains, and in the range of possible values for LHS and RHS
- Usually not done in actual solvers for arithmetic constraints
- Easy to do with Dynamic Programming

Consider the interaction of multiple constraints

- Usually ignored, as only interaction is via domains of shared variables
- Here: Sum and alldifferent interact
 - When considering the bounds, we cannot assume that each variable takes its smallest/largest value independently
 - Find feasible assignment that minimizes/maximizes the total weight
 - To do this properly, we need some non-trivial reasoning
- Do we do this combined reasoning automatically, or only when prompted by the modeler?

Insight Centre for Data Analytics

CP Week 2025

Slide 87

Deduced Implied Constraints

- Look at the partially solved puzzle
 - 9END +10RE
- 10NEY
- In the hundreds position, we have $E+0+C_{10}=N+10*C_{100}$, with C_{10} the 0/1 carry from the tens position
- NB: No carry C_{100} into the thousands, $C_{100} = 0$
- N must be equal to E + 1 with $C_{10} = 1$
- If $C_{10} = 0$, then N = E, not possible
- We can substitute N = E + 1 into our main equation, but keep N = E + 1 as well

Expert Mode Reasoning

Starting with

$$91 * E^{4..7} + 10 * R^{2..8} + D^{2..8} = 90 * N^{5..8} + Y^{2..8}$$

we get

$$91 * E^{4..7} + 10 * R^{2..8} + D^{2..8} = 90 * E^{4..7} + 90 + Y^{2..8}$$

Eliminating duplicate occurrences of E

$$\underbrace{E^{4..7} + 10 * R^{2..8} + D^{2..8}}_{26..95} = \underbrace{90 + Y^{2..8}}_{92..98}$$

shared range 92..95 To reach 92, R must be equal to 8, therefore N, E, D, Y must be less than 8 As N = E + 1, E must be less than 7

$$E^{4..6} + 10 * 8 + D^{2..7} = 90 + Y^{2..7}$$

Simplification yields

$$E^{4..6} + D^{2..7} = 10 + Y^{2..7}$$
6..13
12..17 CP Week 2025

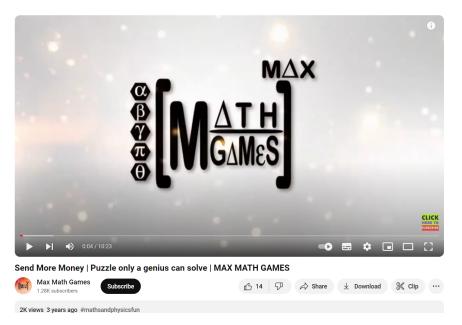

Slide 89

shared range 12..13 To reach 12 on LHS, E must be greater than 4, D must be greater than 5

Expert Mode Summary

- Often there is more propagation that can be done
- Can be difficult/expensive to do
- Balancing
 - How much work it done at each step of search?
 - How many steps of search you need?
- For hard problems, doing all possible propagation may be exponential
- Not aware that any CP system does the full reasoning shown here

This is how people solve the puzzle by hand

 When writing the first version of this puzzle for CHIP (in 1986), we wanted to mimic the way we solve the puzzle by hand

Can we do better?

- The alldifferent constraint is missing propagation
 - How can we do more propagation?
 - Do we know when we derive all possible information from the constraint?
- Constraints only interact by changing domains of variables

Insight Centre for Data Analytics

CP Week 2025

Slide 116

A Simpler Example

```
include "alldifferent.mzn";

var 1..2:X;
var 1..2:Y;
var 1..3:Z;

constraint alldifferent([X,Y,Z]);

solve satisfy;
```

Using Forward Checking

- No variable is assigned
- No reduction of domains
- But, values 1 and 2 can be removed from Z
- This means that Z is assigned to 3

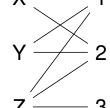

Insight Centre for Data Analytics

CP Week 2025

Slide 118

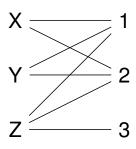

Visualization of alldifferent as Graph

- Variables on the left
- Values on the right
- If value is in domain of variable, show link between them
- This is called a *bipartite* graph

A Simpler Example

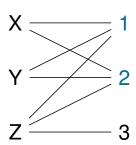

Value Graph for

Insight Centre for Data Analytics

CP Week 2025

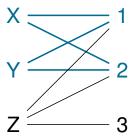

Slide 120

A Simpler Example

Check interval [1,2]

A Simpler Example

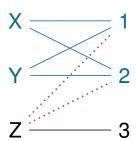

- Find variables completely contained in interval
- There are two: X and Y
- This uses up the capacity of the interval

Insight Centre for Data Analytics

CP Week 2025

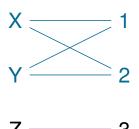

Slide 120

A Simpler Example

No other variable can use that interval

A Simpler Example

Only one value left in domain of Z, this can be assigned

Insight Centre for Data Analytics

CP Week 2025

Slide 120

Idea (Hall Intervals)

- Take each interval of possible values, say size N
- Find all K variables whose domain is completely contained in interval
- If K > N then the constraint is infeasible
- If K = N then no other variable can use that interval
- Remove values from such variables if their bounds change
- If K < N do nothing
- Re-check whenever domain bounds change

Implementation

- Problem: Too many intervals $(O(n^2))$ to consider
- Solution:
 - Check only those intervals which update bounds
 - Enumerate intervals incrementally
 - Starting from lowest(highest) value
 - Using sorted list of variables
- Complexity: $O(n \log(n))$ in standard implementations
- Important: Only looks at min/max bounds of variables

Insight Centre for Data Analytics

CP Week 2025

Slide 122

Bounds Consistency

Definition

A constraint achieves *bounds consistency*, if for the lower and upper bound of every variable, it is possible to find values for all other variables between their lower and upper bounds which satisfy the constraint.

Annotation: :: bounds

```
include "alldifferent.mzn";

var 1..2:X;
var 1..2:Y;
var 1..3:Z;

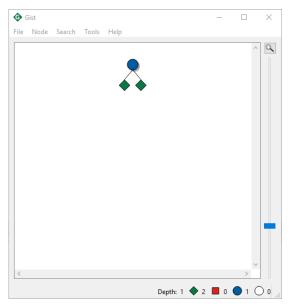

constraint alldifferent([X,Y,Z]) :: bounds;
solve satisfy;
```

Insight Centre for Data Analytics

CP Week 2025

Slide 124

Running with Gecode Gist

All Solutions

Node Inspector (Root)

Can we do even better?

- Bounds consistency only considers min/max bounds
- Ignores "holes" in domain
- Sometimes we can improve propagation looking at those holes

Insight Centre for Data Analytics

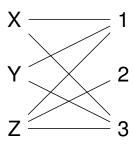

CP Week 2025

Slide 126

Another Simple Example

```
include "alldifferent.mzn";

var {1,3}:X; % note enumerated domain
var {1,3}:Y;
var 1..3:Z; % note domain as interval
% annotated constraint
constraint alldifferent([X,Y,Z]) :: bounds;
solve satisfy;
```

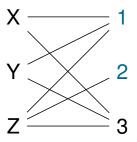

Value Graph for

Insight Centre for Data Analytics

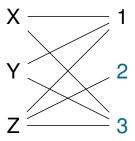

CP Week 2025

Slide 128

Another Simple Example

- Check interval [1,2]
- No domain of a variable completely contained in interval
- No propagation

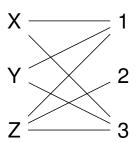

- Check interval [2,3]
- No domain of a variable completely contained in interval
- No propagation

Insight Centre for Data Analytics

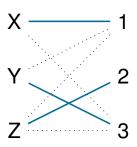

CP Week 2025

Slide 128

Another Simple Example

But, more propagation is possible, there are only two solutions

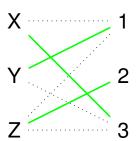

Solution 1: assignment in blue

Insight Centre for Data Analytics

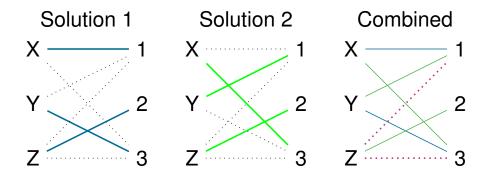

CP Week 2025

Slide 128

Another Simple Example

Solution 2: assignment in green

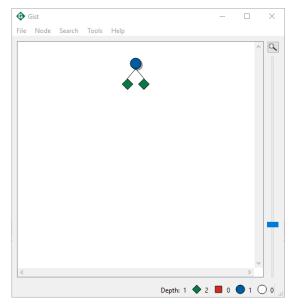

Combining solutions shows that Z=1 and Z=3 are not possible. Can we deduce this without enumerating solutions?

Insight Centre for Data Analytics

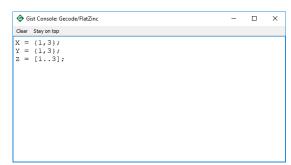

CP Week 2025

Slide 128

Bounds Consistency with Gecode Gist: No Propagation

All Solutions

Node Inspector (Root)

Solutions and Maximal Matchings

- A Matching is subset of edges which do not coincide in any node
- No matching can have more edges than number of variables
- Every solution corresponds to a maximal matching and vice versa
- If a link does not belong to some maximal matching, then it can be removed

Insight Centre for Data Analytics

CP Week 2025

Slide 130

Implementation

- Possible to compute all links which belong to some matching
 - Without enumerating all of them!
- Enough to compute one maximal matching
- Requires algorithm for strongly connected components
- Extra work required if more values than variables
- All links (values in domains) which are not supported can be removed
- Complexity: $O(n^{1.5}d)$

Domain Consistency

Definition

A constraint achieves *domain consistency*, if for every variable and for every value in its domain, it is possible to find values in the domains of all other variables which satisfy the constraint.

- Also called generalized arc consistency (GAC)
- or hyper arc consistency

Insight Centre for Data Analytics

CP Week 2025

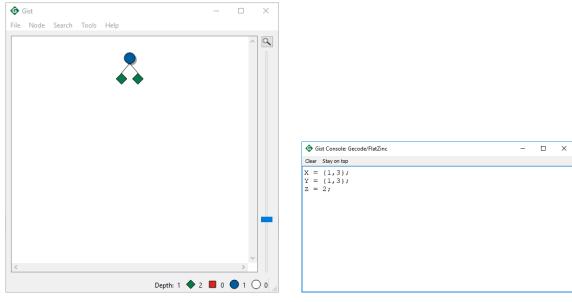

Slide 132

Simple Example Revisited

```
include "alldifferent.mzn";

var {1,3}:X; % note enumerated domain
var {1,3}:Y;
var 1..3:Z; % note domain as interval
% note different annotation
constraint alldifferent([X,Y,Z]) :: domain;
solve satisfy;
```

Domain Consistency with Gecode Gist: Propagation

All Solutions

Node Inspector (Root)

Insight Centre for Data Analytics

CP Week 2025

Slide 134

Can we still do better?

- NO! This extracts all information from this one constraint
- We could perhaps improve speed, but not propagation
- But possible to use different model
- Or model interaction of multiple constraints

Should all constraints achieve domain consistency?

- Domain consistency is usually more expensive than bounds consistency
 - Overkill for simple problems
 - Nice to have choices
- For some constraints achieving domain consistency is NP-hard
 - We have to live with more restricted propagation

CP Week 2025

Slide 142

Typical?

- This does not always happen
- Sometimes, two methods produce same amount of propagation
- Possible to predict in certain special cases
- In general, tradeoff between speed and propagation
- Not always fastest to remove inconsistent values early
- But often required to find a solution at all

Simple search routine

- Enumerate variables in given order
- Try values starting from smallest one in domain
- Complete, chronological backtracking
- Advantage: Results can be compared with each other
- Disadvantage: Usually not a very good strategy

Insight Centre for Data Analytics

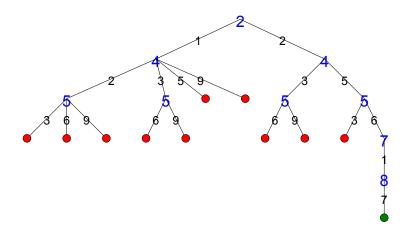

CP Week 2025

Slide 145

Asking for Naive Search in MiniZinc

Search Tree (Domain Consistency)

Insight Centre for Data Analytics

CP Week 2025

Slide 149

Trading Propagation Against Search

- If we perform more propagation, search is more constrained
- Fewer values left, fewer alternatives to explore in search
- Best compromise is not obvious
- But can be learned from examples or during search
- Annotations are optional
 - Some MiniZinc back-end solvers do the search they want, not the one you specify
 - Some solvers simply do not work in a way that these search annotations apply

Are there other Global Constraints?

- alldifferent is the most commonly used constraint
- Propagation methods can be explained
- But there are many more

Insight Centre for Data Analytics

CP Week 2025

Slide 152

Global Constraint Catalog

- https://sofdem.github.io/gccat/
- Description of 354 global constraints, 2800 pages
- Not all of them are widely used
- Detailed, meta-data description of constraints in Prolog

Families of Global Constraints

- Value Counting
 - alldifferent, global cardinality
- Scheduling
 - cumulative
- Properties of Sequences
 - sequence, no_valley
- Graph Properties
 - circuit, tree

Common Algorithmic Techniques

- Bi-Partite Matchning
- Flow Based Algorithms
- Automata
- Task Intervals
- Reduced Cost Filtering
- Decomposition

Part III

Customizing Search

Insight Centre for Data Analytics

CP Week 2025

Slide 156

What we want to introduce

- Importance of search strategy, constraints alone are not enough
- Two schools of thought
 - Black-box solver, solver decides by itself
 - Human control over process
- Dynamic variable ordering exploits information from propagation
- Variable and value choice
- Hard to find strategy which works all the time
- Different way of improving stability of search routine

Example Problem

- N-Queens puzzle
- Rather weak constraint propagation
- Many solutions, limited number of symmetries
- Easy to scale problem size

Insight Centre for Data Analytics

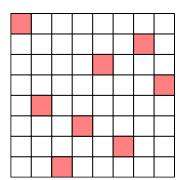

CP Week 2025

Slide 158

Problem Definition

8-Queens

Place 8 queens on an 8×8 chessboard so that no queen attacks another. A queen attacks all cells in horizontal, vertical and diagonal direction. Generalizes to boards of size $N \times N$.

Solution for board size 8 × 8

Basic Model

- Cell based Model
 - A 0/1 variable for each cell to say if it is occupied or not
 - Constraints on rows, columns and diagonals to enforce no-attack
 - N^2 variables, 6N 2 constraints
- Column (Row) based Model
 - A 1..N variable for each column, stating position of queen in the column
 - Based on observation that each column must contain exactly one queen
 - N variables, $N^2/2$ binary constraints

Insight Centre for Data Analytics

CP Week 2025

Slide 162

Model

assign
$$[X_1, X_2, ... X_N]$$

s.t.

$$\forall 1 \leq i \leq N : \quad X_i \in 1..N$$
 $\forall 1 \leq i < j \leq N : \quad X_i \neq X_j$
 $\forall 1 \leq i < j \leq N : \quad X_i + j \neq X_j + i$
 $\forall 1 \leq i < j \leq N : \quad X_i + i \neq X_j + j$

Default Strategy

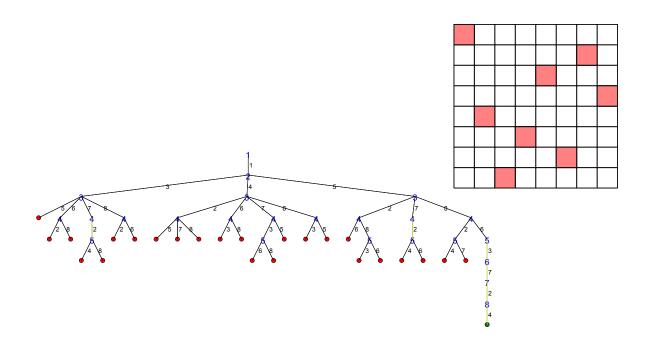

Insight Centre for Data Analytics

CP Week 2025

Slide 171

First Solution

Observations

- Even for small problem size, tree can become large
- Not interested in all details
- Ignore all automatically fixed variables
- For more compact representation abstract failed sub-trees

Insight Centre for Data Analytics

CP Week 2025

Slide 173

Compact Representation

Number inside triangle: Number of choices
Number under triangle: Number of failures

Exploring other board sizes

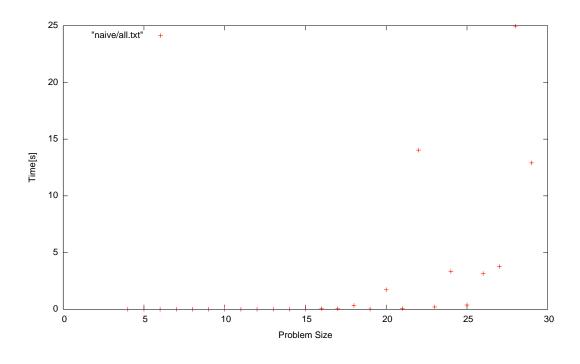

- How stable is the model?
- Try all sizes from 4 to 100
- Timeout of 100 seconds

Insight Centre for Data Analytics

CP Week 2025

Slide 175

Naive Stategy, Problem Sizes 4-100

Observations

- Time very reasonable up to size 20
- Sizes 20-30 times very variable
- Not just linked to problem size
- No size greater than 30 solved within timeout

Insight Centre for Data Analytics

CP Week 2025

Slide 177

Possible Improvements

- Better constraint reasoning
 - Remodelling problem with 3 alldifferent constraints
 - Global reasoning as described before
- Better control of search
 - Static vs. dynamic variable ordering
 - Better value choice
 - Not using complete depth-first chronological backtracking

Static vs. Dynamic Variable Ordering

- Heuristic Static Ordering
 - Sort variables before search based on heuristic
 - Most important decisions
 - Smallest initial domain
- Dynamic variable ordering
 - Use information from constraint propagation
 - Different orders in different parts of search tree
 - Use all information available

Insight Centre for Data Analytics

CP Week 2025

Slide 180

First Fail strategy

- Dynamic variable ordering
- At each step, select variable with smallest domain
- Idea: If there is a solution, better chance of finding it
- Idea: If there is no solution, smaller number of alternatives
- Needs tie-breaking method

Search Stategy Choices

Modified MiniZinc Program

```
int: n=8;
array[1..n] of var 1..n: queens;
constraint
    forall(i, j in 1..n where i < j) (
        queens[i] != queens[j] /\
        queens[i] + i != queens[j] + j /\
        queens[i] - i != queens[j] - j
);
solve :: int_search(
        queens,
        first_fail,
        indomain_min)
        satisfy;</pre>
```

Variable Choice (MiniZinc)

- Determines the order in which variables are assigned
- input_order assign variables in static order given
- smallest assign variable with smallest value in domain first
- first_fail select variable with smallest domain first
- dom_w_deg consider ratio of domain size and failure count
- Others, including programmed selection for specific solvers

Insight Centre for Data Analytics

CP Week 2025

Slide 184

Value Choice (MiniZinc)

- Determines the order in which values are tested for selected variables
- indomain_min Start with smallest value, on backtracking try next larger value
- indomain_median Start with value closest to middle of domain
- indomain_random Choose values in random order
- indomain_split Split domain into two intervals

▶ Continue

Modified Choco-solver Model

```
int n = 8;
Model model = new Model(n + "-queens problem");
IntVar[] vars = model.intVarArray("Q", n, 1, n, false);
IntVar[] diag1 = IntStream.range(0, n).
                           mapToObj(i -> vars[i].sub(i).intVar()).
                           toArray(IntVar[]::new);
IntVar[] diag2 = IntStream.range(0, n).
                          mapToObj(i -> vars[i].add(i).intVar()).
                           toArray(IntVar[]::new);
model.post(
   model.allDifferent(vars),
    model.allDifferent(diag1),
   model.allDifferent(diag2)
Solver solver = model.getSolver();
solver.showStatistics();
solver.setSearch(Search.domOverWDegSearch(vars));
Solution solution = solver.findSolution();
if (solution != null) {
    System.out.println(solution.toString());
```

Insight Centre for Data Analytics

CP Week 2025

Slide 186

VariableSelector Choice (Choco-solver)

- Determines the order in which variables are assigned
- InputOrder assign variables in static order given
- Smallest assign variable with smallest value in domain first
- FirstFail select variable with smallest domain first
- DomOverWDeg consider ratio of domain size and failure count
- ActivityBased dynamic, based on dynamic observed behaviour
- ImpactBased dynamic, based on dynamic observed behaviour

IntValueSelector Choice (Choco-solver)

- Determines the order in which values are tested for selected variables
- IntDomainMin Start with smallest value, on backtracking try next larger value
- IntDomainMiddle Start with value closest to middle of domain
- IntDomainRandom Choose values in random order
- IntDomainRandomBound Randomly choose between smallest and largest value

FirstFail Strategy (Size 16)

Comparing Solutions

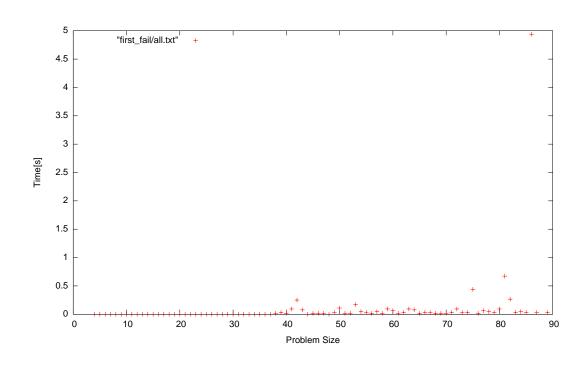

Solutions are different!

Insight Centre for Data Analytics

CP Week 2025

Slide 192

FirstFail, Problem Sizes 4-100

Observations

- This is much better
- But some sizes are much harder
- Timeout for sizes 88, 91, 93, 97, 98, 99

Insight Centre for Data Analytics

CP Week 2025

Slide 194

More Reactive Variable Selection

- Domain size is important, but other information is useful as well
- Dom/Weighted Degree: better results in many situations
- Weight Degree: count how often variable has been involved in failure
- Focus on more complicated part of problem
- Changes during search, learns from past performance
- Option dom_w_deg

Weighted Degree Variable Selection

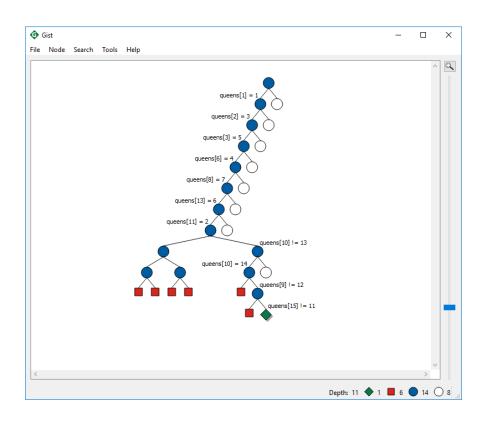

```
int: n=8;
array[1..n] of var 1..n: queens;
constraint
    forall(i, j in 1..n where i < j) (
        queens[i] != queens[j] /\
        queens[i] + i != queens[j] + j /\
        queens[i] - i != queens[j] - j
    )
;
solve :: int_search(
        queens,
        dom_w_deg,
        indomain_random)
        satisfy;</pre>
```

Slide 196

Result for size 16 with Gecode-Gist

Sample Results for Larger Sizes

Insight Centre for Data Analytics

CP Week 2025

Slide 198

Approach 1: Heuristic Portfolios

- Try multiple strategies for the same problem
- With multi-core CPUs, run them in parallel
- Only one needs to be successful for each problem

Approach 2: Restart with Randomization

- Only spend limited number of backtracks for a search attempt
- When this limit is exceeded, restart at beginning
- Requires randomization to explore new search branch
- Randomize variable choice by random tie break
- Randomize value choice by shuffling values
- Needs strategy when to restart

Insight Centre for Data Analytics

CP Week 2025

Slide 200

Random Variable Choice and Restarts

```
int: n=8;
array[1..n] of var 1..n: queens;
constraint
    forall(i, j in 1..n where i < j) (
        queens[i] != queens[j] /\
        queens[i] + i != queens[j] + j /\
        queens[i] - i != queens[j] - j
    )
;
solve :: int_search(
        queens,
        dom_w_deg,
        indomain_random)
        :: random_linear(100)
        satisfy;</pre>
```

Approach 3: Partial Search

- Abandon depth-first, chronological backtracking
- Don't get locked into a failed sub-tree
- A wrong decision at a level is not detected, and we have to explore the complete subtree below to undo that wrong choice
- Explore more of the search tree
- Spend time in promising parts of tree

CP Week 2025

Slide 202

Example: Credit Search

- Not available in all solvers
- Explore top of tree completely, based on credit
- Start with fixed amount of credit
- Each node consumes one credit unit
- Split remaining credit amongst children
- When credit runs out, start bounded backtrack search
- Each branch can use only K backtracks
- If this limit is exceeded, jump to unexplored top of tree

Credit, Search Tree Problem Size 94

CP Week 2025

Slide 204

Credit, Problem Sizes 4-200

Points to Remember

- Choice of search can have huge impact on performance
- Dynamic variable selection can lead to large reduction of search space
- Packaged search can do a lot, but programming search adds even more
- Depth-first chronological backtracking not always best choice
- How to control this explosion of search alternatives?

Slide 206

Part IV

What is missing?

Many Specialized Topics

- How to design efficient core engine
- Hybrids with LP/MIP tools
- Hybrids with SAT
- Symmetry breaking
- Use of MDD/BDD to encode sets of solutions
- High level modelling tools
- Debugging/visualization

Insight Centre for Data Analytics

CP Week 2025

Slide 208

Reformulation

- Just because the user has modelled it this way, it doesn't mean we have to solve it that way
 - Replace some constraint(s) by other, equivalent constraints
 - Because we don't have that constraint in our system
 - For performance

Learning

- While solving the problem we can learn how to strengthen the model/search
 - Understand which constraints/method contribute to propagation and change schedule
 - Learn no-good constraints by explaining failure
 - Adapt search strategy based on search experience
