Slide 3

## **Objectives**

- Overview of Core Constraint Programming
- Three Main Concepts
  - Constraint Propagation
  - Global Constraints
  - Customizing Search
- Topics will be treated in more detail in later parts of the school
- Based on Examples, not Formal Description

#### **Outline**

- Why Constraint Programming?
- Constraint Propagation
- Global Constraints
- Customizing Search

Insight Centre for Data Analytics

CP Week 2024

Slide 5

# Tutorial Based on ECLiPSe ELearning Course

- Self-study course in constraint programming
- Supported by Cisco Systems and Silicon Valley Community Foundation
- Multi-media format, video lectures, slides, handout etc
- https://eclipseclp.org/ELearning/index.html

#### Also Part of CRT-AI Constraint Week

- Annual one week course on CP and Optimization in Ireland
- Part of national training program for PhD students in AI
- https://www.crt-ai.ie/

Insight Centre for Data Analytics

CP Week 2024

Slide 7

## Constraint Programming - in a nutshell

- Declarative description of problems with
  - Variables which range over (finite) sets of values
  - Constraints over subsets of variables which restrict possible value combinations
  - A solution is a value assignment which satisfies all constraints
- Constraint propagation/reasoning
  - Removing inconsistent values for variables
  - Detect failure if constraint can not be satisfied
  - Interaction of constraints via shared variables
  - Incomplete
- Search
  - User controlled assignment of values to variables
  - Each step triggers constraint propagation
- Different domains require/allow different methods

## **Constraint Programming is Different**

- Declarative Programming
  - Concentrate on what you want
  - Not how to get there
  - Program != Algorithm
  - Program = Model
- Applied to Combinatorial Problems
  - No complete polynomial algorithms known (exist?)
  - CP less ad-hoc than heuristics
  - Models can evolve

Insight Centre for Data Analytics

CP Week 2024

Slide 9

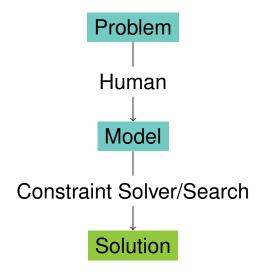

#### **A Subtractive Process**

"Oh, bosh, as Mr. Ruskin says. Sculpture, per se, is the simplest thing in the world. All you have to do is to take a big chunk of marble and a hammer and chisel, make up your mind what you are about to create and chip off all the marble you don't want."-Paris Gaulois.

Source: https://quoteinvestigator.com/2014/06/22/chip-away/

#### **Basic Process**

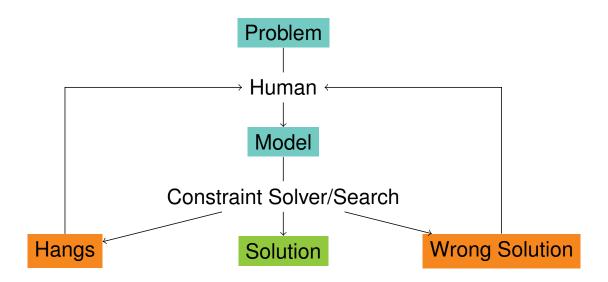

Insight Centre for Data Analytics

CP Week 2024

Slide 11

#### **More Realistic**

#### **Dual Role of Model**

- Allows Human to Express Problem
  - Close to Problem Domain
  - Constraints as Abstractions
- Allows Solver to Execute
  - Variables as Communication Mechanism
  - Constraints as Algorithms

Insight Centre for Data Analytics

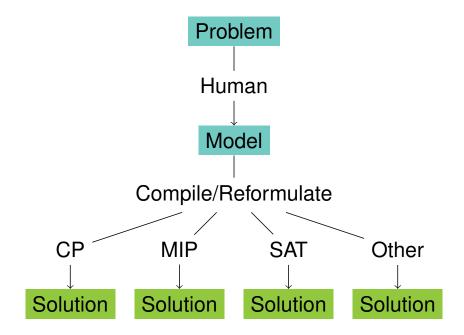

CP Week 2024

Slide 13

# **Modelling Frameworks**

- MiniZinc (NICTA, Monash University, Australia)
- NumberJack (Insight, Ireland)
- EssencePrime/SavilleRow (UK)
- CPMpy (KU Leuven)
- Allow use of multiple back-end solvers
- Compile model into variants for each solver
- A priori solver independent model(CP, MIP, SAT)

#### Framework Process

Insight Centre for Data Analytics

CP Week 2024

Slide 15

# Why use Puzzles as Examples?

- Easy to understand the problem
- Solvable by hand without specialized knowledge
- Possible to compare automated to manual solving process

The puzzle, though inanimate, is presented as a solvable problem without lasting negative consequences, a very low-risk low-reward situation. By being a puzzle, the object is attempting to convince the user that it must be completed.

#### Part I

# **Basic Constraint Propagation**

Insight Centre for Data Analytics

CP Week 2024

Slide 17

## Example 1: SEND+MORE=MONEY

- Example of Finite Domain Constraint Problem
- Models and Programs
- Constraint Propagation and Search
- Some Basic Constraints: linear arithmetic, alldifferent, disequality
- A Built-in search
- Visualizers for variables, constraints and search

#### **Problem Definition**

#### A Crypt-Arithmetic Puzzle

We begin with the definition of the SEND+MORE=MONEY puzzle. It is often shown in the form of a hand-written addition:

The puzzle was first proposed by Henry Dudeney in the Strand Magazine from 1924.

Insight Centre for Data Analytics

CP Week 2024

Slide 20

#### **Rules**

- Each character stands for a digit from 0 to 9.
- Numbers are built from digits in the usual, positional notation.
- Repeated occurrence of the same character denote the same digit.
- Different characters denote different digits.
- Numbers do not start with a zero.
- The equation must hold.

#### Model

- Each character is a variable, which ranges over the values 0 to 9.
- An alldifferent constraint between all variables, which states that two different variables must have different values. This is a very common constraint, which we will encounter in many other problems later on.
- Two *disequality constraints* (variable *X* must be different from value *V*) stating that the variables at the beginning of a number can not take the value 0.
- An arithmetic equality constraint linking all variables with the proper coefficients and stating that the equation must hold.

## CPMpy Model (from https://github.com/CPMpy/)

# Choco-solver Model (from https://choco-solver.org/)

```
Model model = new Model("SEND+MORE=MONEY");
IntVar S = model.intVar("S", 1, 9, false);
IntVar E = model.intVar("E", 0, 9, false);
IntVar N = model.intVar("N", 0, 9, false);
IntVar D = model.intVar("D", 0, 9, false);
IntVar M = model.intVar("M", 1, 9, false);
IntVar 0 = model.intVar("0", 0, 9, false);
IntVar R = model.intVar("R", 0, 9, false);
IntVar Y = model.intVar("Y", 0, 9, false);
model.allDifferent(new IntVar[]{S, E, N, D, M, O, R, Y}).post();
IntVar[] ALL = new IntVar[]{
    S, E, N, D,
    M, O, R, E,
    M, O, N, E, Y};
int[] COEFFS = new int[]{
    1000, 100, 10, 1,
    1000, 100, 10, 1,
-10000, -1000, -100, -10, -1);
model.scalar(ALL, COEFFS, "=", 0).post();
Solver solver = model.getSolver();
solver.showStatistics();
solver.showSolutions();
solver.findSolution();
▶ Continue
```

CP Week 2024

Slide 29

## A Note on Syntax

- Some formulations may seem simpler than others
- This largely is an artifact of a very simple problem
- In most models, you do not write down constraints one by one
- You create constraints based on data
- Ease of integration becomes more important than syntax
- Debugging tools for those who need a debugger :-)

#### **Choice of Model**

- This is one model, not the model of the problem
- Many possible alternatives
- Choice often depends on your constraint system
  - Constraints available
  - Reasoning attached to constraints
- Not always clear which is the best model
- Often: Not clear what is the problem

Slide 36

#### **Alldifferent Constraint**

```
include "alldifferent.mzn";
constraint alldifferent([S,E,N,D,M,O,R,Y]);
```

- Built-in alldifferent predicate included
- No initial propagation possible
- Suspends, waits until variables are changed
- When variable is fixed, remove value from domain of other variables
- Forward checking

#### **Alldifferent Visualization**

Uses the same representation as the domain visualizer

CP Week 2024

Slide 42

# **Simplified Equation**

$$1000 * S + 91 * E + 10 * R + D = 9000 * M + 900 * O + 90 * N + Y$$

## **Propagation**

$$\underbrace{\frac{1000 * S^{1..9} + 91 * E^{0..9} + 10 * R^{0..9} + D^{0..9}}_{1000..9918} = \underbrace{\frac{1000..9918}{9000 * M^{1..9} + 900 * O^{0..9} + 90 * N^{0..9} + Y^{0..9}}_{9000..89919}}$$

**Deduction:** 

$$M = 1, S = 9, O \in \{0..1\}$$

Why? ▶ Skip

Insight Centre for Data Analytics

CP Week 2024

Slide 44

#### Consider lower bound for S

$$\underbrace{1000*S^{1..9} + 91*E^{0..9} + 10*R^{0..9} + D^{0..9}}_{9000..9918} = \underbrace{9000*M^{1..9} + 900*O^{0..9} + 90*N^{0..9} + Y^{0..9}}_{9000..9918}$$

- Lower bound of equation is 9000
- Rest of lhs (left hand side)  $(91 * E^{0..9} + 10 * R^{0..9} + D^{0..9})$  is atmost 918
- S must be greater or equal to  $\frac{9000-918}{1000} = 8.082$ 
  - otherwise lower bound of equation not reached by lhs
- S is integer, therefore  $S \ge \left\lceil \frac{9000-918}{1000} \right\rceil = 9$
- S has upper bound of 9, so S = 9

## Consider upper bound of M

$$\underbrace{1000*S^{1..9} + 91*E^{0..9} + 10*R^{0..9} + D^{0..9}}_{9000..9918} = \underbrace{9000*M^{1..9} + 900*O^{0..9} + 90*N^{0..9} + Y^{0..9}}_{9000..9918}$$

- Upper bound of equation is 9918
- Rest of rhs (right hand side) 900 \* O<sup>0..9</sup> + 90 \* N<sup>0..9</sup> + Y<sup>0..9</sup> is at least 0
- *M* must be smaller or equal to  $\frac{9918-0}{9000} = 1.102$
- M must be integer, therefore  $M \le \lfloor \frac{9918-0}{9000} \rfloor = 1$
- M has lower bound of 1, so M = 1

Insight Centre for Data Analytics

CP Week 2024

Slide 46

## Consider upper bound of O

$$\underbrace{1000*S^{1..9}+91*E^{0..9}+10*R^{0..9}+D^{0..9}}_{9000..9918}=\underbrace{9000*M^{1..9}+900*O^{0..9}+90*N^{0..9}+Y^{0..9}}_{9000..9918}$$

- Upper bound of equation is 9918
- Rest of rhs (right hand side) 9000 \* 1 + 90 \* N<sup>0..9</sup> + Y<sup>0..9</sup> is at least 9000
- *O* must be smaller or equal to  $\frac{9918-9000}{900} = 1.02$
- O must be integer, therefore  $O \le \lfloor \frac{9918-9000}{900} \rfloor = 1$
- O has lower bound of 0, so  $O \in \{0..1\}$

# Search Tree with Gecode/GIST

#### Some Differences

- Uses binary branching
  - var equal value, var not equal value
- Solutions in green, failure leafs in red, internal nodes in blue
- By default, shows all failed sub trees collapsed
- By default, uses different search strategy

Insight Centre for Data Analytics

CP Week 2024

Slide 78

#### **Solution**

#### Points to Remember

- Constraint models are expressed by variables and constraints.
- Problems can have many different models, which can behave quite differently. Choosing the best model is an art.
- Constraints can take many different forms.
- Propagation deals with the interaction of variables and constraints.
- It removes some values that are inconsistent with a constraint from the domain of a variable.
- Constraints only communicate via shared variables.

Insight Centre for Data Analytics

CP Week 2024

Slide 81

#### Points to Remember

- Propagation usually is not sufficient, search may be required to find a solution.
- Propagation is data driven, and can be quite complex even for small examples.
- The default search uses chronological depth-first backtracking, systematically exploring the complete search space.
- The search choices and propagation are interleaved, after every choice some more propagation may further reduce the problem.

#### For Puzzle Purists Only

- We did not follow the puzzler ethos!
- We should solve the puzzle without making choices
- Even a case analysis should be avoided
- The puzzle has a single solution, we should be able to deduce the solution
- In the process shown, we are limited by the underlying assumptions
  - Treat each constraint on its own, they interact only by domains of variables
  - We only use the constraints that we stated in the model
- Can we do better than that?

Insight Centre for Data Analytics

CP Week 2024

Slide 83

## **Better Reasoning**

- Three possible approaches (possibly many more)
  - Full domain reasoning for arithmetic, not just bound reasoning
  - Interaction of *sum* and *alldifferent* constraints
  - Deduced implied constraint

## Looking at more than just bounds

- We only considered the smallest and largest values that can be achieved in the sum constraint
- We can do more
  - Can any of the values between be expressed as the sum of the terms
  - Consider holes in the domains, and in the range of possible values for LHS and RHS
- Usually not done in actual solvers for arithmetic constraints
- Easy to do with Dynamic Programming

Insight Centre for Data Analytics

CP Week 2024

Slide 85

# Consider the interaction of multiple constraints

- Usually ignored, as only interaction is via domains of shared variables
- Here: Sum and alldifferent interact
  - When considering the bounds, we cannot assume that each variable takes its smallest/largest value independently
  - Find feasible assignment that minimizes/maximizes the total weight
  - To do this properly, we need some non-trivial reasoning
- Do we do this combined reasoning automatically, or only when prompted by the modeler?

## **Deduced Implied Constraints**

- Look at the partially solved puzzle
  - 9END +10RE
- 10NEY
- In the hundreds position, we have  $E + 0 + C_{10} = N + 10 * C_{100}$ , with  $C_{10}$  the 0/1 carry from the tens position
- NB: No carry  $C_{100}$  into the thousands,  $C_{100} = 0$
- N must be equal to E + 1 with  $C_{10} = 1$
- If  $C_{10} = 0$ , then N = E, not possible
- We can substitute N = E + 1 into our main equation, but keep N = E + 1 as well

Insight Centre for Data Analytics

CP Week 2024

Slide 87

## **Expert Mode Reasoning**

Starting with

$$91 * E^{4..7} + 10 * R^{2..8} + D^{2..8} = 90 * N^{5..8} + Y^{2..8}$$

we get

$$91 * E^{4..7} + 10 * R^{2..8} + D^{2..8} = 90 * E^{4..7} + 90 + Y^{2..8}$$

Eliminating duplicate occurrences of E

$$\underbrace{E^{4..7} + 10 * R^{2..8} + D^{2..8}}_{26..95} = \underbrace{90 + Y^{2..8}}_{92..98}$$

shared range 92..95 To reach 92, R must be equal to 8, therefore N, E, D, Y must be less than 8 As N = E + 1, E must be less than 7

$$E^{4..6} + 10 * 8 + D^{2..7} = 90 + Y^{2..7}$$

Simplification yields

$$E^{4..6} + D^{2..7} = 10 + Y^{2..7}$$
6..13

## **Expert Mode Summary**

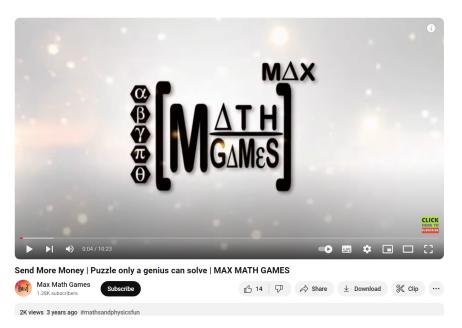

- Often there is more propagation that can be done
- Can be difficult/expensive to do
- Balancing
  - How much work it done at each step of search?
  - How many steps of search you need?
- For hard problems, doing all possible propagation may be exponential
- Not aware that any CP system does the full reasoning shown here

Insight Centre for Data Analytics

Slide 89

## This is how people solve the puzzle by hand

 When writing the first version of this puzzle for CHIP (in 1986), we wanted to mimic the way we solve the puzzle by hand

# Part II

# **Global Constraints**

Insight Centre for Data Analytics

CP Week 2024

Slide 91

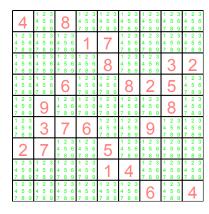

# Example 2: Sudoku

- Global Constraints
  - Powerful modelling abstractions
  - Non-trivial propagation
  - Different consistency levels
- Example: Sudoku puzzle

#### **Problem Definition**

#### Sudoku

Fill in numbers from 1 to 9 so that each row, column and 3x3 block contain each number exactly once

4	2	8	5	6	3	1	7	9
3	5	တ	~	7	2	4	60	80
7	6	$\overline{}$	4	8	တ	5	ന	2
1	4	6	3	9	8	2	5	7
5	9	2	7	4	1	3	8	6
8	3	7	6	2	5	9	4	1
2	7	4	တ	5	6	8	$\overline{}$	3
6	8	ദ	2	1	4	7	ഠാ	5
9	1	5	8	3	7	6	2	4

Insight Centre for Data Analytics

CP Week 2024

Slide 94

#### Model

- A variable for each cell, ranging from 1 to 9
- A 9x9 matrix of variables describing the problem
- Preassigned integers for the given hints
- alldifferent constraints for each row, column and 3x3 block

CP Week 2024

Slide 113

#### Can we do better?

- The alldifferent constraint is missing propagation
  - How can we do more propagation?
  - Do we know when we derive all possible information from the constraint?
- Constraints only interact by changing domains of variables

## A Simpler Example

```
include "alldifferent.mzn";

var 1..2:X;
var 1..2:Y;
var 1..3:Z;

constraint alldifferent([X,Y,Z]);
solve satisfy;
```

Insight Centre for Data Analytics

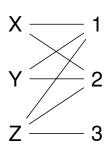

CP Week 2024

Slide 116

# **Using Forward Checking**

- No variable is assigned
- No reduction of domains
- But, values 1 and 2 can be removed from Z
- This means that Z is assigned to 3

# Visualization of all different as Graph

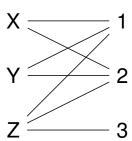

- Show problem as graph with two types of nodes
  - Variables on the left
  - Values on the right
- If value is in domain of variable, show link between them
- This is called a *bipartite* graph

Insight Centre for Data Analytics

CP Week 2024

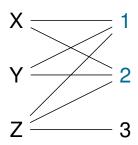

Slide 118

# A Simpler Example

Value Graph for

## A Simpler Example

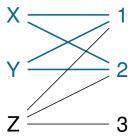

Check interval [1,2]

Insight Centre for Data Analytics

CP Week 2024

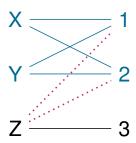

Slide 119

# A Simpler Example

- Find variables completely contained in interval
- There are two: X and Y
- This uses up the capacity of the interval

## A Simpler Example

No other variable can use that interval

Insight Centre for Data Analytics

CP Week 2024

Slide 119

# A Simpler Example

Z ----- 3

Only one value left in domain of Z, this can be assigned

## Idea (Hall Intervals)

- Take each interval of possible values, say size N
- Find all K variables whose domain is completely contained in interval
- If K > N then the constraint is infeasible
- If K = N then no other variable can use that interval
- Remove values from such variables if their bounds change
- If K < N do nothing</li>
- Re-check whenever domain bounds change

Insight Centre for Data Analytics

CP Week 2024

Slide 120

## **Implementation**

- Problem: Too many intervals  $(O(n^2))$  to consider
- Solution:
  - Check only those intervals which update bounds
  - Enumerate intervals incrementally
  - Starting from lowest(highest) value
  - Using sorted list of variables
- Complexity:  $O(n \log(n))$  in standard implementations
- Important: Only looks at min/max bounds of variables

## **Bounds Consistency**

#### Definition

A constraint achieves *bounds consistency*, if for the lower and upper bound of every variable, it is possible to find values for all other variables between their lower and upper bounds which satisfy the constraint.

Insight Centre for Data Analytics

CP Week 2024

Slide 122

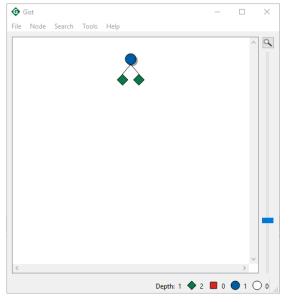

#### Annotation: :: bounds

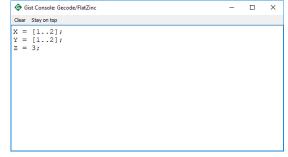

```
include "alldifferent.mzn";

var 1..2:X;
var 1..2:Y;
var 1..3:Z;

constraint alldifferent([X,Y,Z]) :: bounds;
solve satisfy;
```

## Running with Gecode Gist

**All Solutions** 

Node Inspector (Root)

Insight Centre for Data Analytics

CP Week 2024

Slide 124

#### Can we do even better?

- Bounds consistency only considers min/max bounds
- Ignores "holes" in domain
- Sometimes we can improve propagation looking at those holes

```
include "alldifferent.mzn";

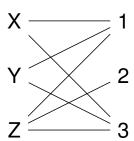

var {1,3}:X; % note enumerated domain
var {1,3}:Y;
var 1..3:Z; % note domain as interval
% annotated constraint
constraint alldifferent([X,Y,Z]) :: bounds;
solve satisfy;
```

Solution 2: assignment in green

Insight Centre for Data Analytics

CP Week 2024

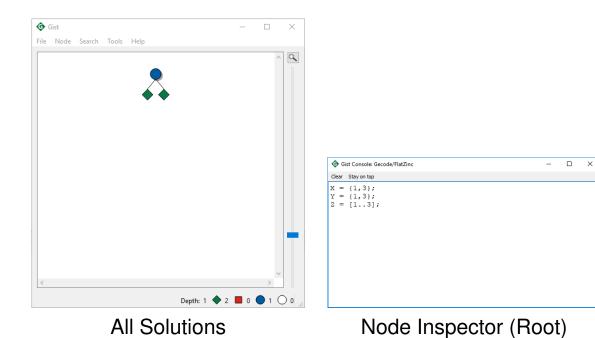

Slide 127

## **Another Simple Example**

Combining solutions shows that Z=1 and Z=3 are not possible. Can we deduce this without enumerating solutions?

# Bounds Consistency with Gecode Gist: No Propagation

Insight Centre for Data Analytics

CP Week 2024

Slide 128

## **Solutions and Maximal Matchings**

- A Matching is subset of edges which do not coincide in any node
- No matching can have more edges than number of variables
- Every solution corresponds to a maximal matching and vice versa
- If a link does not belong to some maximal matching, then it can be removed

## **Implementation**

- Possible to compute all links which belong to some matching
  - Without enumerating all of them!
- Enough to compute one maximal matching
- Requires algorithm for *strongly connected components*
- Extra work required if more values than variables
- All links (values in domains) which are not supported can be removed
- Complexity: O(n<sup>1.5</sup>d)

Insight Centre for Data Analytics

CP Week 2024

Slide 130

## **Domain Consistency**

#### Definition

A constraint achieves *domain consistency*, if for every variable and for every value in its domain, it is possible to find values in the domains of all other variables which satisfy the constraint.

- Also called generalized arc consistency (GAC)
- or hyper arc consistency

## Simple Example Revisited

```
include "alldifferent.mzn";

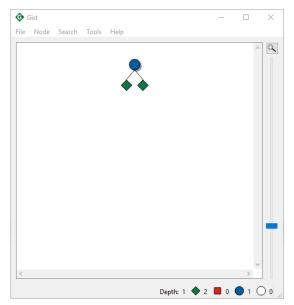

var {1,3}:X; % note enumerated domain
var {1,3}:Y;
var 1..3:Z; % note domain as interval
% note different annotation
constraint alldifferent([X,Y,Z]) :: domain;
solve satisfy;
```

Insight Centre for Data Analytics

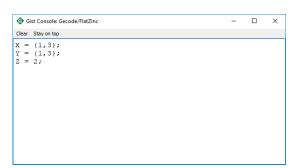

CP Week 2024

Slide 132

## Domain Consistency with Gecode Gist: Propagation

All Solutions

Node Inspector (Root)

#### Can we still do better?

- NO! This extracts all information from this one constraint
- We could perhaps improve speed, but not propagation
- But possible to use different model
- Or model interaction of multiple constraints

Insight Centre for Data Analytics

CP Week 2024

Slide 134

# Should all constraints achieve domain consistency?

- Domain consistency is usually more expensive than bounds consistency
  - Overkill for simple problems
  - Nice to have choices
- For some constraints achieving domain consistency is NP-hard
  - We have to live with more restricted propagation

## **Modified MiniZinc Program**

Insight Centre for Data Analytics

CP Week 2024

Slide 136

#### Modified Choco-solver Sudoku Model

```
Model model = new Model("Sudoku");
    int blockSize = 3;
    int m = blockSize*blockSize;
    IntVar[][] vars = new IntVar[m][m];
    for(int i=0;i<m;i++){
        for (int j=0; j < m; j++) {
            vars[i][j] = model.intVar("X"+i+""+j, 1, m);
            if (data[i][j]>0) {
                model.arithm(vars[i][j], "=", data[i][j]).post();
// Consistency level AC: domain consistency, BC: bounds consistency, default: mix
    for (int i=0; i < m; i++) {
        model.allDifferent(row(i,m,vars),AC).post();
        model.allDifferent(column(i, m, vars), AC).post();
    for(int i=0;i<m;i+=blockSize) {</pre>
        for(int j=0; j<m; j+=blockSize) {</pre>
           model.allDifferent(block(i,j,blockSize,vars),AC).post();
    Solver solver = model.getSolver();
    solver.solve();
```

Bounds Consistency

**Domain Consistency** 

$\overline{}$		_	_		_		_	
4	2	8	5	6	3	1	7 9	7 9
3	5	3	1	7	2	4	6	8
7	6	1	4	8	9	5	3	2
1	4	6	7 9	3	8	2	5	7
5	9	2	7	4	1	7	8	6
8	3	7	6	2	5	9	4	1
2	7	4	3	5	6	8	1	3
6	8	3	2	1	4	7	7 9	5
3	1	5	8	3	7	6	2	4

## Typical?

- This does not always happen
- Sometimes, two methods produce same amount of propagation
- Possible to predict in certain special cases
- In general, tradeoff between speed and propagation
- Not always fastest to remove inconsistent values early
- But often required to find a solution at all

Insight Centre for Data Analytics

CP Week 2024

Slide 142

## Simple search routine

- Enumerate variables in given order
- Try values starting from smallest one in domain
- Complete, chronological backtracking
- Advantage: Results can be compared with each other
- Disadvantage: Usually not a very good strategy

## Asking for Naive Search in MiniZinc

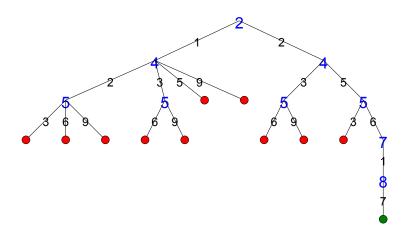

```
solve :: int_search(
   puzzle,
   input_order,
   indomain_min)
satisfy;
```

Insight Centre for Data Analytics

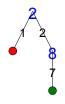

CP Week 2024

Slide 145

## Search Tree (Forward Checking)

# Search Tree (Bounds Consistency)

Insight Centre for Data Analytics

CP Week 2024

Slide 147

# Search Tree (Domain Consistency)

#### **Trading Propagation Against Search**

- If we perform more propagation, search is more constrained
- Fewer values left, fewer alternatives to explore in search
- Best compromise is not obvious
- But can be learned from examples or during search
- Annotations are optional
  - Some MiniZinc back-end solvers do the search they want, not the one you specify
  - Some solvers simply do not work in a way that these search annotations apply

Insight Centre for Data Analytics

CP Week 2024

Slide 149

#### Are there other Global Constraints?

- alldifferent is the most commonly used constraint
- Propagation methods can be explained
- But there are many more

#### **Global Constraint Catalog**

- https://sofdem.github.io/gccat/
- Description of 354 global constraints, 2800 pages
- Not all of them are widely used
- Detailed, meta-data description of constraints in Prolog

Insight Centre for Data Analytics

CP Week 2024

Slide 152

#### **Families of Global Constraints**

- Value Counting
  - alldifferent, global cardinality
- Scheduling
  - cumulative
- Properties of Sequences
  - sequence, no\_valley
- Graph Properties
  - circuit, tree

## **Common Algorithmic Techniques**

- Bi-Partite Matchning
- Flow Based Algorithms
- Automata
- Task Intervals
- Reduced Cost Filtering
- Decomposition

Insight Centre for Data Analytics

CP Week 2024

Slide 154

## Part III

**Customizing Search** 

#### What we want to introduce

- Importance of search strategy, constraints alone are not enough
- Two schools of thought
  - Black-box solver, solver decides by itself
  - Human control over process
- Dynamic variable ordering exploits information from propagation
- Variable and value choice
- Hard to find strategy which works all the time
- Different way of improving stability of search routine

Insight Centre for Data Analytics

CP Week 2024

Slide 156

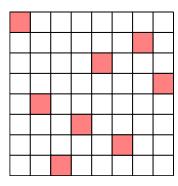

### **Example Problem**

- N-Queens puzzle
- Rather weak constraint propagation
- Many solutions, limited number of symmetries
- Easy to scale problem size

#### **Problem Definition**

#### 8-Queens

Place 8 queens on an  $8 \times 8$  chessboard so that no queen attacks another. A queen attacks all cells in horizontal, vertical and diagonal direction. Generalizes to boards of size  $N \times N$ .

Solution for board size  $8 \times 8$ 

Insight Centre for Data Analytics

CP Week 2024

Slide 159

#### **Basic Model**

- Cell based Model
  - A 0/1 variable for each cell to say if it is occupied or not
  - Constraints on rows, columns and diagonals to enforce no-attack
  - $N^2$  variables, 6N 2 constraints
- Column (Row) based Model
  - A 1..N variable for each column, stating position of queen in the column
  - Based on observation that each column must contain exactly one gueen
  - N variables,  $N^2/2$  binary constraints

#### Model

assign 
$$[X_1, X_2, ... X_N]$$

s.t.

$$\forall 1 \le i \le N : X_i \in 1..N$$
  
 $\forall 1 \le i < j \le N : X_i \ne X_j$ 

$$\forall 1 \leq i < j \leq N : X_i + j \neq X_j + i$$

 $\forall \, 1 \leq i < j \leq N: \quad X_i + i \neq X_j + j$

CP Week 2024

Slide 173

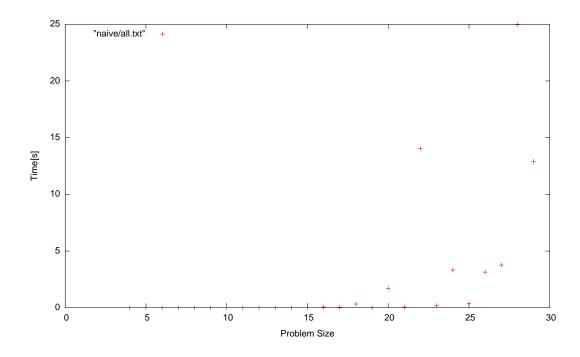

Number of choices

Number of failures

## Exploring other board sizes

- How stable is the model?
- Try all sizes from 4 to 100
- Timeout of 100 seconds

## Naive Stategy, Problem Sizes 4-100

Insight Centre for Data Analytics

CP Week 2024

Slide 175

#### **Observations**

- Time very reasonable up to size 20
- Sizes 20-30 times very variable
- Not just linked to problem size
- No size greater than 30 solved within timeout

#### Possible Improvements

- Better constraint reasoning
  - Remodelling problem with 3 alldifferent constraints
  - Global reasoning as described before
- Better control of search
  - Static vs. dynamic variable ordering
  - Better value choice
  - Not using complete depth-first chronological backtracking

Insight Centre for Data Analytics

CP Week 2024

Slide 178

### Static vs. Dynamic Variable Ordering

- Heuristic Static Ordering
  - Sort variables before search based on heuristic
  - Most important decisions
  - Smallest initial domain
- Dynamic variable ordering
  - Use information from constraint propagation
  - Different orders in different parts of search tree
  - Use all information available

### First Fail strategy

- Dynamic variable ordering
- At each step, select variable with smallest domain
- Idea: If there is a solution, better chance of finding it
- Idea: If there is no solution, smaller number of alternatives
- Needs tie-breaking method

Insight Centre for Data Analytics

CP Week 2024

### **Modified MiniZinc Program**

```
int: n=8;
array[1..n] of var 1..n: queens;
constraint
    forall(i, j in 1..n where i < j) (
        queens[i] != queens[j] /\
        queens[i] + i != queens[j] + j /\
        queens[i] - i != queens[j] - j
    )
;
solve :: int_search(
        queens,
        first_fail,
        indomain_min)
        satisfy;</pre>
```

Insight Centre for Data Analytics

CP Week 2024

Slide 182

## Variable Choice (MiniZinc)

- Determines the order in which variables are assigned
- input\_order assign variables in static order given
- smallest assign variable with smallest value in domain first
- first\_fail select variable with smallest domain first
- dom\_w\_deg consider ratio of domain size and failure count
- Others, including programmed selection for specific solvers

#### Value Choice (MiniZinc)

- Determines the order in which values are tested for selected variables
- indomain\_min Start with smallest value, on backtracking try next larger value
- indomain\_median Start with value closest to middle of domain
- indomain\_random Choose values in random order
- indomain\_split Split domain into two intervals

▶ Continue

CP Week 2024

Slide 184

#### Modified Choco-solver Model

```
int n = 8;
Model model = new Model(n + "-queens problem");
IntVar[] vars = model.intVarArray("Q", n, 1, n, false);
IntVar[] diag1 = IntStream.range(0, n).
                          mapToObj(i -> vars[i].sub(i).intVar()).
                           toArray(IntVar[]::new);
IntVar[] diag2 = IntStream.range(0, n).
                           mapToObj(i -> vars[i].add(i).intVar()).
                           toArray(IntVar[]::new);
model.post(
   model.allDifferent(vars),
   model.allDifferent(diag1),
   model.allDifferent(diag2)
Solver solver = model.getSolver();
solver.showStatistics();
solver.setSearch(Search.domOverWDegSearch(vars));
Solution solution = solver.findSolution();
if (solution != null) {
    System.out.println(solution.toString());
```

### VariableSelector Choice (Choco-solver)

- Determines the order in which variables are assigned
- InputOrder assign variables in static order given
- Smallest assign variable with smallest value in domain first
- FirstFail select variable with smallest domain first
- DomOverWDeg consider ratio of domain size and failure count
- ActivityBased dynamic, based on dynamic observed behaviour
- ImpactBased dynamic, based on dynamic observed behaviour

Insight Centre for Data Analytics

CP Week 2024

Slide 186

## IntValueSelector Choice (Choco-solver)

- Determines the order in which values are tested for selected variables
- IntDomainMin Start with smallest value, on backtracking try next larger value
- IntDomainMiddle Start with value closest to middle of domain
- IntDomainRandom Choose values in random order
- IntDomainRandomBound Randomly choose between smallest and largest value

► Continue

## **Comparison**

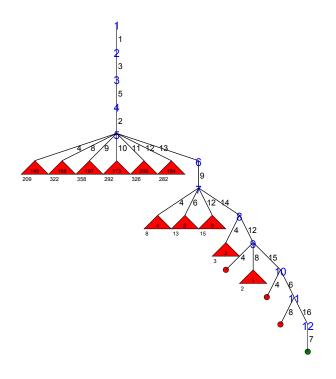

- Board size 16x16
- Naive (Input Order) Strategy
- First Fail variable selection

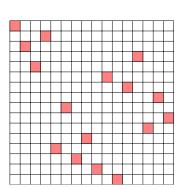

Insight Centre for Data Analytics

CP Week 2024

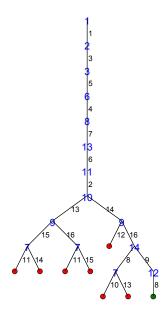

Slide 188

# Naive (Input Order) Strategy (Size 16)

# FirstFail Strategy (Size 16)

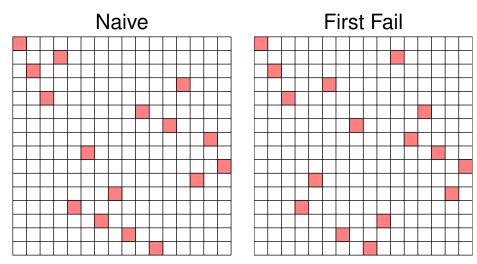

Insight Centre for Data Analytics

CP Week 2024

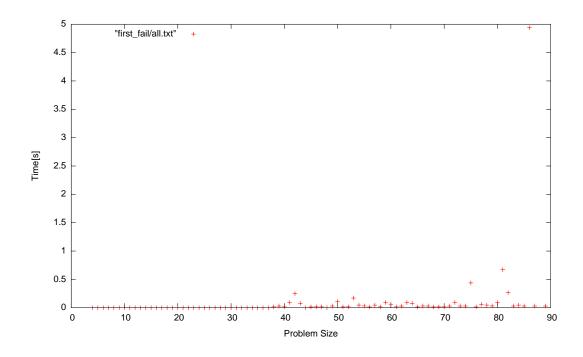

Slide 190

# **Comparing Solutions**

Solutions are different!

# FirstFail, Problem Sizes 4-100

Insight Centre for Data Analytics

CP Week 2024

Slide 192

## **Observations**

- This is much better
- But some sizes are much harder
- Timeout for sizes 88, 91, 93, 97, 98, 99

#### More Reactive Variable Selection

- Domain size is important, but other information is useful as well
- Dom/Weighted Degree: better results in many situations
- Weight Degree: count how often variable has been involved in failure
- Focus on more complicated part of problem
- Changes during search, learns from past performance
- Option dom\_w\_deg

Insight Centre for Data Analytics

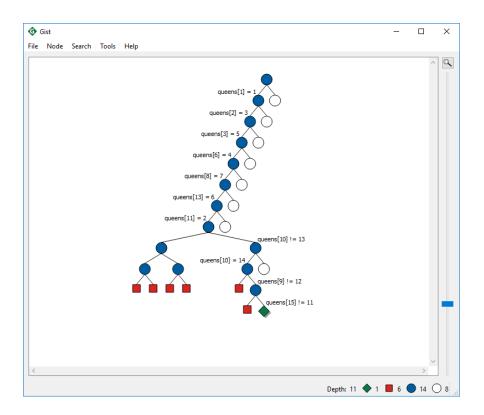

CP Week 2024

Slide 194

## Weighted Degree Variable Selection

```
int: n=8;
array[1..n] of var 1..n: queens;
constraint
    forall(i, j in 1..n where i < j) (
        queens[i] != queens[j] /\
        queens[i] + i != queens[j] + j /\
        queens[i] - i != queens[j] - j
)
;
solve :: int_search(
        queens,
        dom_w_deg,
        indomain_random)
        satisfy;</pre>
```

### Result for size 16 with Gecode-Gist

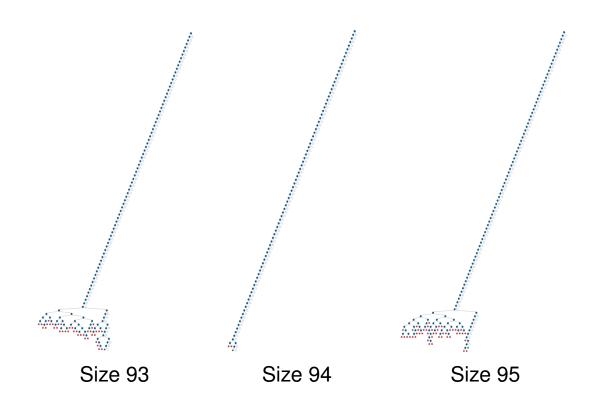

Insight Centre for Data Analytics

CP Week 2024

Slide 196

# Sample Results for Larger Sizes

## **Approach 1: Heuristic Portfolios**

- Try multiple strategies for the same problem
- With multi-core CPUs, run them in parallel
- Only one needs to be successful for each problem

Insight Centre for Data Analytics

CP Week 2024

Slide 198

## **Approach 2: Restart with Randomization**

- Only spend limited number of backtracks for a search attempt
- When this limit is exceeded, restart at beginning
- Requires randomization to explore new search branch
- Randomize variable choice by random tie break
- Randomize value choice by shuffling values
- Needs strategy when to restart

#### Random Variable Choice and Restarts

```
int: n=8;
array[1..n] of var 1..n: queens;
constraint
  forall(i, j in 1..n where i < j) (
        queens[i] != queens[j] /\
        queens[i] + i != queens[j] + j /\
        queens[i] - i != queens[j] - j
   );
solve :: int_search(
        queens,
        dom_w_deg,
        indomain_random)
        :: random_linear(100)
        satisfy;</pre>
```

Insight Centre for Data Analytics

CP Week 2024

Slide 200

### Approach 3: Partial Search

- Abandon depth-first, chronological backtracking
- Don't get locked into a failed sub-tree
- A wrong decision at a level is not detected, and we have to explore the complete subtree below to undo that wrong choice
- Explore more of the search tree
- Spend time in promising parts of tree

#### **Example: Credit Search**

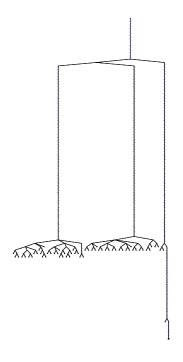

- Not available in all solvers
- Explore top of tree completely, based on credit
- Start with fixed amount of credit
- Each node consumes one credit unit
- Split remaining credit amongst children
- When credit runs out, start bounded backtrack search
- Each branch can use only *K* backtracks
- If this limit is exceeded, jump to unexplored top of tree

Insight Centre for Data Analytics

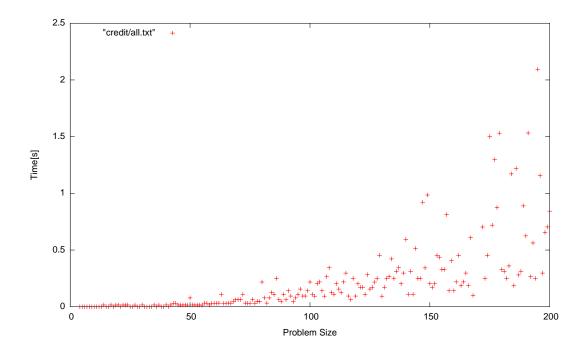

CP Week 2024

Slide 202

### Credit, Search Tree Problem Size 94

#### Credit, Problem Sizes 4-200

Insight Centre for Data Analytics

CP Week 2024

Slide 204

#### Points to Remember

- Choice of search can have huge impact on performance
- Dynamic variable selection can lead to large reduction of search space
- Packaged search can do a lot, but programming search adds even more
- Depth-first chronological backtracking not always best choice
- How to control this explosion of search alternatives?

#### Part IV

# What is missing?

Insight Centre for Data Analytics

CP Week 2024

Slide 206

## **Many Specialized Topics**

- How to design efficient core engine
- Hybrids with LP/MIP tools
- Hybrids with SAT
- Symmetry breaking
- Use of MDD/BDD to encode sets of solutions
- High level modelling tools
- Debugging/visualization

#### Reformulation

- Just because the user has modelled it this way, it doesn't mean we have to solve it that way
  - Replace some constraint(s) by other, equivalent constraints
  - Because we don't have that constraint in our system
  - For performance

Insight Centre for Data Analytics

CP Week 2024

Slide 208

## Learning

- While solving the problem we can learn how to strengthen the model/search
  - Understand which constraints/method contribute to propagation and change schedule
  - Learn no-good constraints by explaining failure
  - Adapt search strategy based on search experience
